

5 symbols. 1 goal: process-based collaboration. Simply done with S-BPM.

S-BPM stands for “subject-oriented business process management” and is setting new standards in today’s BPM arena. This globally unique method was developed by Dr. Albert Fleischmann. It is a BPM revolution with the goal of creating dynamic business applications quickly and easily, integrating them promptly and seamlessly into the existing IT and executing them within a portal. The result is a process-oriented, agile collaboration thriving on change.

S-BPM focuses on the subjects, i.e. the people who are actively engaged in the process. Without special IT knowledge, business users can model their processes by themselves, interactively validate them together with their colleagues and immediately execute them as workflows. The software for running the processes is automatically created from the process models.

What exactly does “subject-oriented“ mean?

Just as in the grammatical context between subject, predicate, and object, the approach here focuses on the behavior of each individual participant in the process (This could be a human being or a computer system). Metasonic refers to this behavior or pattern within a process as a “subject”. Subjects are active.

In drawing parallels to grammar, in every language you can identify a subject that describes the active part of a sentence. By contrast, the object is passive and represents something or someone involved in the subject’s behavior. Back in the world of processes, this could be for example data or databases.

S-BPM lives communication

This means that S-BPM first of all acknowledges the fact that process participants communicate with each other in order to structure and tune the desired process results or respectively, to ideally collaborate. In this way a very important aspect of your company’s organizational culture is addressed. Because processes are a form of organization.

A fine distinction

The key to global competitiveness and agility is speed. S-BPM provides the optimal basis. Using just 5 symbols every business user can create processes or applications efficiently and cost-effectively in accordance with compliance rules and make changes on the fly – all in the blink of an eye.

Advantages at a glance:

- ✔ Employee communications play a pivotal role
- ✔ Creation of complex processes and business applications with just 5 symbols
- ✔ Compliance is built into each process from the very beginning
- ✔ Process logic can be immediately validated interactively and then executed in a process portal
- ✔ Seamless integration into the existing IT landscape
- ✔ Highly motivated employees because they themselves can react quickly and flexibly to changes
- ✔ Ideal collaboration
- ✔ Significant economic benefit:
Let’s assume you save 10 hours per process change at an hourly rate of € 100. Consequently, 1,000 process changes or new process launches per year would result in a total savings of 1,000,000 euros!

The focus is thereby on the structured communication of all process participants. A single central control flow, a component of many other BPM tools, is no longer required.

The end of shadow IT

Thanks to S-BPM, individual ad-hoc and creative processes can be integrated in the central IT landscape by the employees themselves, even while the process is running, i.e. in real time. Thus, high-risk shadow IT can be avoided. S-BPM relies on a single modeling environment for business as well as for IT and therefore harmonizes their communication. Our approach avoids useless interviews, diverse reconsiderations, and errors which are usually not detected until implementation and initial operation. It motivates all participants to make contributions for process improvements on an ongoing basis, cuts down considerably on cost-intensive changes and helps companies obtain a very high level of agility. This is how we define the future of BPM.

Easing the burden on IT

Through S-BPM a paradigm shift in the world of business processes is created. Processes do not have to be adapted to IT capabilities any more. Instead, employees describe from a business point of view who needs to communicate when and with whom, and which services they require to do so. In short: The burden on IT is lightened and more responsibility is shifted to operational business departments. IT can now concentrate on the seamless provision of IT Infrastructure. S-BPM impresses thereby with its platform-independent integration in real time. This is how you can build on your previous investments.

“Built-in compliance”

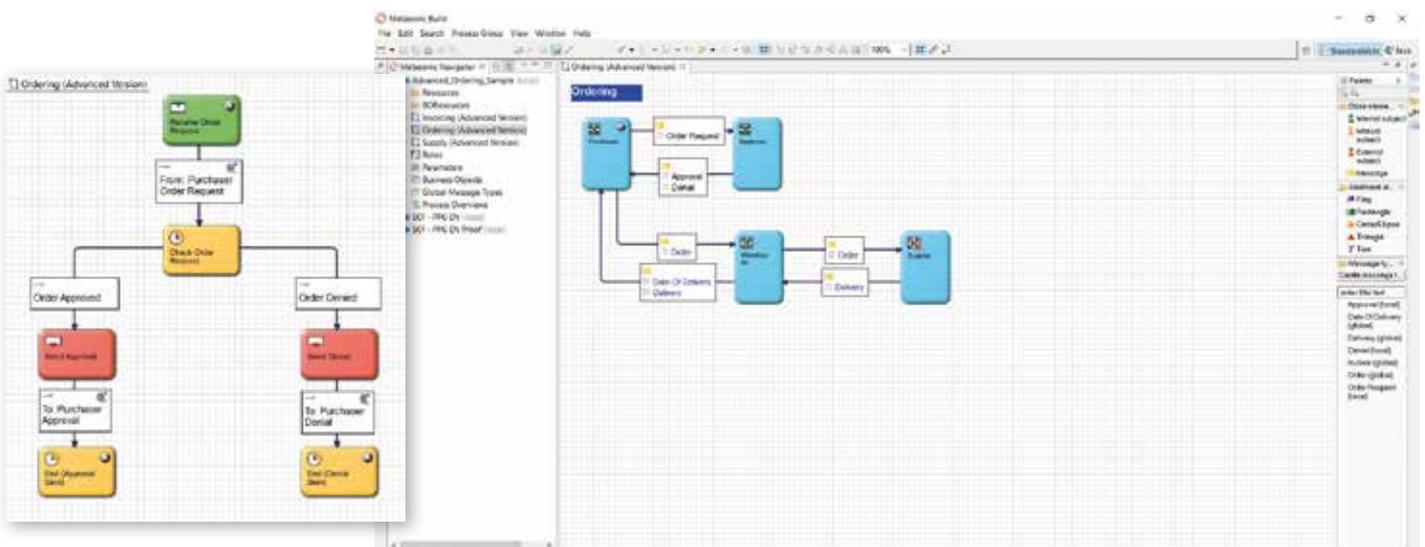

All employees are supported in performing their daily work through a personalized process portal which offers built-in compliance in process models right from the start. Thus, they automatically act in conformance with the rules. The S-BPM approach puts this into practice.

Revolutionary approach:

“ It’s never been so easy to rapidly create business applications and link them together. Using S-BPM our platform generates transparent and secure processes, which thrive on a dynamic communication flow. The result is a goal-oriented efficient collaboration with an optimal time to market at reduced costs - the ideal basis for growth and success.

“

Herbert Kindermann,
Managing Director,
Allgeier IT Solutions GmbH

Only 5 symbols: Process applications created, modified and executed in a portal - all in the blink of an eye.
